

Social Science Part 1 — Cbse Chapter Test — 20 Marks

ANSWER KEY — FOR GRADING

Subject: Social Science Part 1 | Class: Class 8

Total Marks: 20 | Time Allowed: 0h 40m | CBSE

General Instructions:

1. Read all questions carefully before answering.
2. All questions are compulsory unless stated otherwise.
3. Marks for each question are indicated on the right.
4. Write neatly and legibly.

Q.NO.	QUESTIONS	MARKS
Section A Attempt all 8 questions. Each carries 1 mark(s).		
1	What was one consequence of farmers shifting to high-yielding varieties of wheat and paddy in Punjab? (A) Decrease in use of chemical fertilisers (B) Lower groundwater extraction (C) Reduced electricity consumption (D) Greater need for water than traditional seeds Answer: Correct Option: (D) ► Why? D. Greater need for water than traditional seeds because high-yielding varieties of wheat and paddy required more water than traditional seeds, leading farmers to extract more groundwater. [Ch 1: Natural Resources and Their Use]	1
2	According to the chapter, what practices does Vṛikṣhāyurveda recommend for sustainable agriculture? Consider its guidance on soil, seeds, irrigation, and pest management. (A) Only the use of chemical fertilisers and pesticides (B) Specific plants for different soil types, seed preservation methods, irrigation techniques varying by species and season, natural pest repellents, and crop rotation (C) Only monocropping and chemical inputs (D) Only modern industrial farming methods Answer: Correct Option: (B)	1

Q.NO.	QUESTIONS	MARKS
	► Why? The chapter describes Vṛikṣhāyurveda's recommendations: elaborate recommendations on the specific plants to be grown on different soil types, intricate methods for seed collection, preservation, and pre-planting treatments, irrigation techniques varying according to plant species, growth stage, and seasonal conditions, pest management strategies through natural repellents, and crop rotation and mixed cropping. ► Step-by-step: 1. Step 1: List the Vṛikṣhāyurveda practices mentioned in the chapter. 2. Step 2: Note soil-specific plant recommendations. 3. Step 3: Note seed collection and preservation methods. 4. Step 4: Note irrigation techniques, natural pest management, and crop rotation. [Ch 1: Natural Resources and Their Use]	
3	The chapter describes the International Solar Alliance as an example of India's leadership in renewable energy. When was it launched and by which countries? (A) Launched in 2010 by India alone (B) Launched in 2015 by India and France as a coalition of sunshine-rich countries committed to harnessing solar power (C) Launched in 2020 by the United Nations (D) Launched in 2000 by European countries Answer: Correct Option: (B) ► Why? The chapter states: India and France launched the International Alliance for Solar Energy (IASE) in 2015 — a coalition of sunshine-rich countries committed to harnessing solar power. The alliance focuses on countries with abundant sunlight throughout the year. ► Step-by-step: 1. Step 1: Locate the section on 'The International Solar Alliance'. 2. Step 2: Note the year: 2015. 3. Step 3: Note the countries: India and France. 4. Step 4: Note the purpose: coalition of sunshine-rich countries for solar power. [Ch 1: Natural Resources and Their Use]	1
4	What natural ingredients did Pema's family use to prepare pest repellents? (A) Turmeric and ginger (B) Neem and turmeric (C) Neem and garlic (D) Tulsi and cardamom Answer: Correct Option: (C) ► Why? C. Neem and garlic because the source states that Pema's family 'prepared natural pest repellents using neem and garlic.' [Ch 1: Natural Resources and Their Use]	1

Q.NO.	QUESTIONS	MARKS
5	What does the concept of 'lokasangraha' from the Bhagavad Gītā refer to? (A) The idea that everyone must transcend personal desires and act for the wellbeing of all (B) The concept of preserving ancient texts (C) The principle of using only renewable resources (D) The practice of worshipping nature and trees Answer: Correct Option: (A) ► Why? A. The idea that everyone must transcend personal desires and act for the wellbeing of all because the source explicitly defines lokasangraha with these words. <i>[Ch 1: Natural Resources and Their Use]</i>	1
6	What harmful effect does the fine dust released during cement production have on living beings? (A) It causes skin diseases (B) It enters lungs and damages them (C) It affects only plants and not humans (D) It increases temperature in the surroundings Answer: Correct Option: (B) ► Why? B. It enters lungs and damages them because the source explicitly states that the fine dust from cement production enters our lungs and those of animals, damaging them. <i>[Ch 1: Natural Resources and Their Use]</i>	1
7	What does the term 'Vṛikṣhāyurveda' mean when broken down into its Sanskrit components? (A) Tree medicine and plant care (B) Forest and water conservation (C) Tree and the science of life or health (D) Plants and agricultural methods Answer: Correct Option: (C) ► Why? C. Tree and the science of life or health because the source states that 'vṛikṣha' means tree and 'ayurveda' means the science of life or health. <i>[Ch 1: Natural Resources and Their Use]</i>	1
8	What principle of Nature is illustrated by the example of a fallen tree decomposing in a forest? (A) Decomposition is harmful for the ecosystem (B) Nature works in cycles where there is no waste (C) Nature produces maximum waste (D) Only large organisms contribute to soil Answer: Correct Option: (B)	1

Q.NO.	QUESTIONS	MARKS
	► Why? B. Nature works in cycles where there is no waste because the source uses the fallen tree example to illustrate that 'Nature works in cycles where there is no waste.' [Ch 1: Natural Resources and Their Use]	
Section B Attempt all 3 questions. Each carries 2 mark(s).		
9	What are ecosystem services? Answer: Ecosystem services are natural processes that benefit humans. For example, when a forest naturally filters water, prevents soil erosion, and provides habitat for animals, humans benefit from clean water, protected farmland, and pollinated crops. ► Why? This question tests the distinction between ecosystem functions and the benefits humans receive from them. [Ch 1: Natural Resources and Their Use]	2
10	What is the difference between ecosystem functions and ecosystem services? Answer: Ecosystem functions are the natural ways in which Nature works, such as trees producing oxygen or forests filtering water. Ecosystem services are the benefits humans receive from these natural processes, like clean water from forest filtration or pollinated crops. ► Why? This question tests the conceptual distinction between natural processes and the benefits humans derive from them. [Ch 1: Natural Resources and Their Use]	2
11	What is the 'natural resource curse' or 'paradox of plenty'? Answer: The natural resource curse is a phenomenon where regions rich in natural resources experience slower economic growth and development. Having abundant natural resources does not guarantee prosperity, as economies may fail to develop industries that convert resources into higher-value products. ► Why? This question tests understanding of a counter-intuitive economic concept about resource abundance and development outcomes. [Ch 1: Natural Resources and Their Use]	2
Section C Attempt 2 out of 3.		
12	What are the implications of the uneven distribution of natural resources across the planet?	3

Q.NO.	QUESTIONS	MARKS
	Answer: Natural resources are not evenly distributed across the planet or within countries. This uneven distribution shapes human settlements, influences trade patterns, affects international relations, and leads to conflicts. Many wars have been fought to gain control over natural resources. The distribution also affects national and international trade, which depends on the geographical location of resources. Combined with human knowledge and skills, resources can create unique products, as seen historically with Wootz steel. Trade fuelled the development of large empires in India, demonstrating how resource distribution influences economic and political power. ► Why? This answer outlines multiple implications of uneven resource distribution including settlement patterns, trade, conflicts, and historical consequences mentioned in the source. ► Step-by-step: 1. Resources are unevenly distributed across the planet and within countries 2. This distribution shapes human settlements, trade patterns, international relations, and leads to conflicts 3. Many wars have been fought to gain control over natural resources 4. Trade depends on the geographical location of resources 5. Resources combined with human knowledge and skills create unique products like Wootz steel 6. Resource distribution influences economic and political power [Ch 1: Natural Resources and Their Use]	
	OR What is the 'natural resource curse'? How has India generally avoided this phenomenon? Answer: The 'natural resource curse' or 'paradox of plenty' is a phenomenon where regions rich in natural resources experience slower economic growth and development. Having abundant resources does not automatically mean prosperity because economies are frequently unable to develop industries that convert resources into products of higher value. Countries may remain stuck exporting raw resources rather than developing processing industries. India has generally avoided this curse by investing in the development of industries that convert natural resources into finished products to meet growing needs, thereby creating higher economic value from available resources. ► Why? This answer defines the resource curse paradox and explains India's approach to avoiding it through industrial development, as stated in the source. ► Step-by-step: 1. Step 1: Define natural resource curse as slower growth despite resource abundance 2. Step 2: Explain why - inability to develop industries converting resources to higher-value products 3. Step 3: Describe how India avoided this by investing in such industries	

Q.NO.	QUESTIONS	MARKS
	[Ch 1: Natural Resources and Their Use]	
13	What are renewable and non-renewable resources? Explain how Nature demonstrates the principle of restoration and regeneration. Answer: Natural resources can be categorised as renewable or non-renewable based on whether Nature can restore and regenerate them. Renewable resources exhibit characteristics of restoration and regeneration over time—like abundant sunshine across most of India, or rivers replenished through natural cycles. Non-renewable resources cannot be easily replaced once used. Nature demonstrates restoration as the process of returning something to its original healthy state—like a forest recovering after a wildfire or skin healing from a cut. Regeneration goes further, creating new life and thriving conditions. Nature works in cycles with no waste—when a tree falls, bacteria, fungi, and insects decompose it; the tree enriches the soil; and new plants grow from seeds. This cycle continues, showing how renewability is embedded in natural processes. Responsible use ensures non-renewables last until sustainable alternatives are found. ► Why? The answer distinguishes between renewable and non-renewable resources and connects them to Nature's restoration and regeneration cycles. ► Step-by-step: 1. Step 1: Define renewable and non-renewable resources. 2. Step 2: Explain restoration with examples like forest recovery. 3. Step 3: Explain regeneration and Nature's waste-free cycles using the fallen tree example. [Ch 1: Natural Resources and Their Use]	3
